

CARTON FLOW

Improves picking efficiency and ensures a faster carton flow.

Built to last.®

FACTS

EAB's conveyors are used for highly effective picking of goods on pallet racking in accordance with the FIFO (first in, first out) and FILO (first in, last out) principles. This ensures that the goods are loaded in and out according to a given order, because the right goods always end up at the front, ready for collection.

It provides ergonomic picking and allows for separate picking and truck lanes, ensuring a high level of personnel safety.

Carton flow is installed with an incline in pallet racking and consists of roller tracks mounted in a frame. The frames are available in various widths and depths. The roller tracks are fitted with plastic wheels, with different centre distances depending on the load weights.

EAB's carton flow is easy to install, requiring no bolts or tools.

HIGH EFFICIENCY

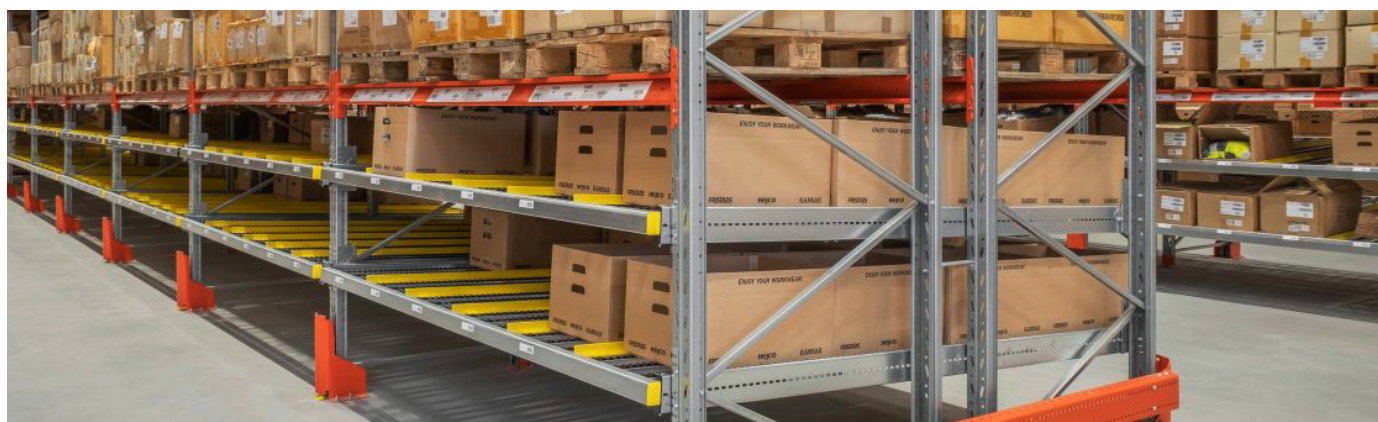

EAB's Carton Flow gives you with high picking efficiency for smaller goods. Conveyors can be adapted according to the size of the goods, type of goods and weight.

ASSEMBLY

Live storage racking is fitting in the pallet rack, which means that you can easily supplement your existing warehouse if your needs changed.

SAFE STORAGE

Carton flow gives the picker access to many items within a limited picking area. Separate picking and truck lanes can be created, improving personnel safety and working conditions.

Carton Flow for picking goods, installed in Omega pallet racking.
